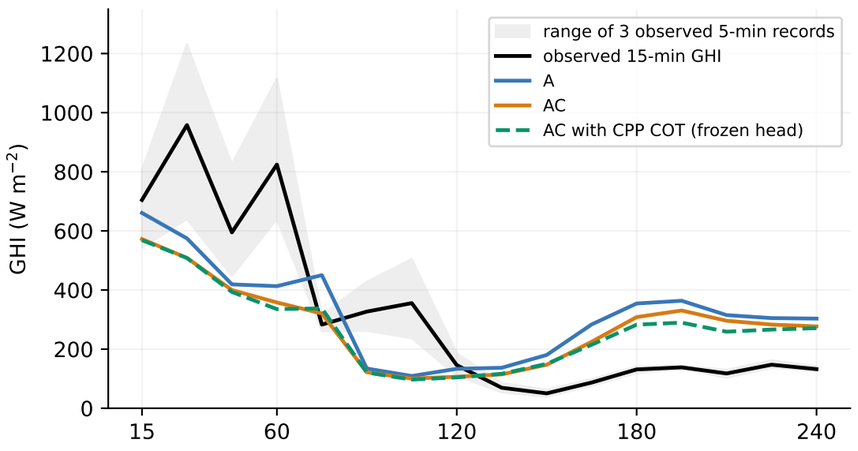
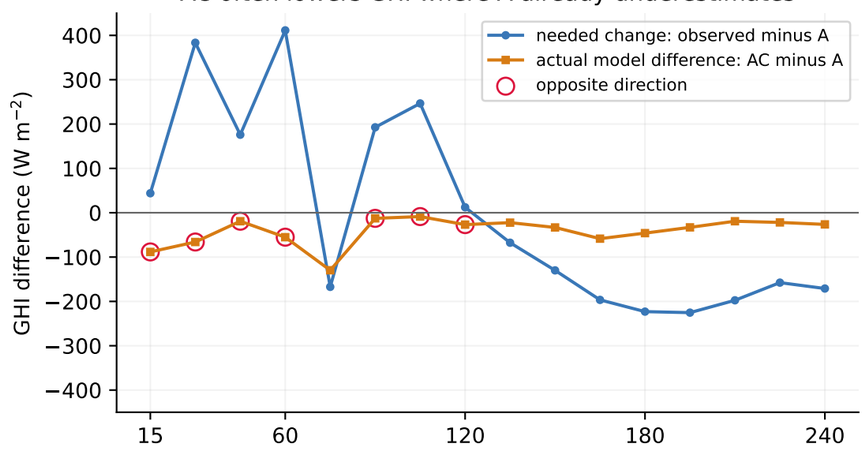
Saved validation outputs: why these COT cases deteriorate
Curves = three-seed mean predictions; RMSE/SSE = mean of seed-wise scores. Zhujia cases share 13/16 targets.

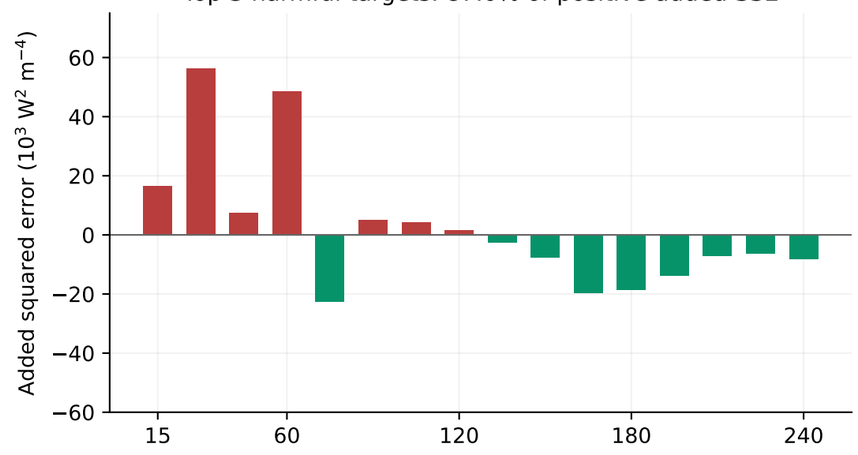
Case 1: Sili | 2025-07-09 13:15:00 BJT
AC minus A case RMSE: +4.56 W m^{-2}



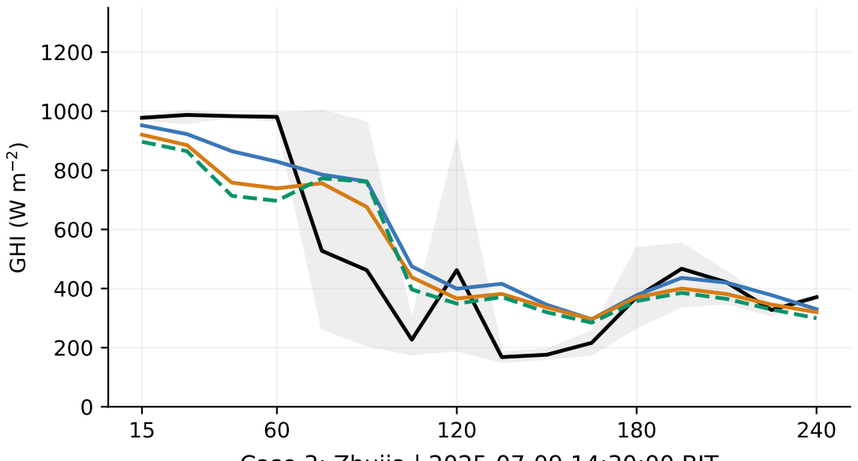
AC often lowers GHI where A already underestimates



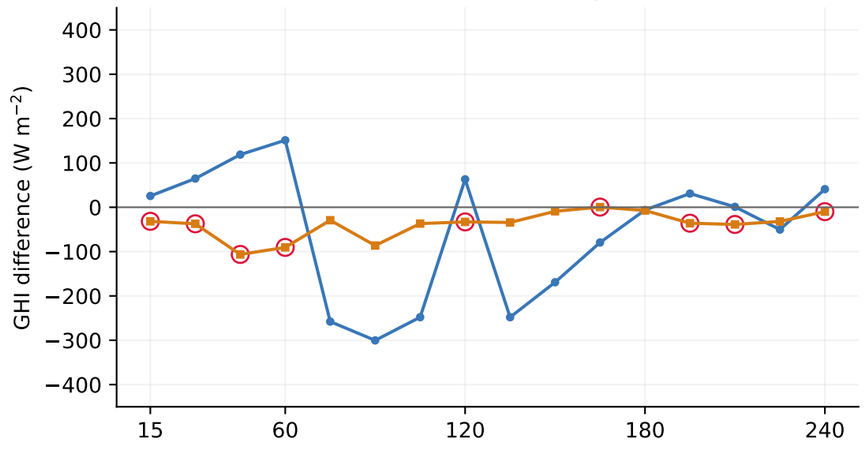
Red = worse; green = better
Top 3 harmful targets: 87.0% of positive added SSE



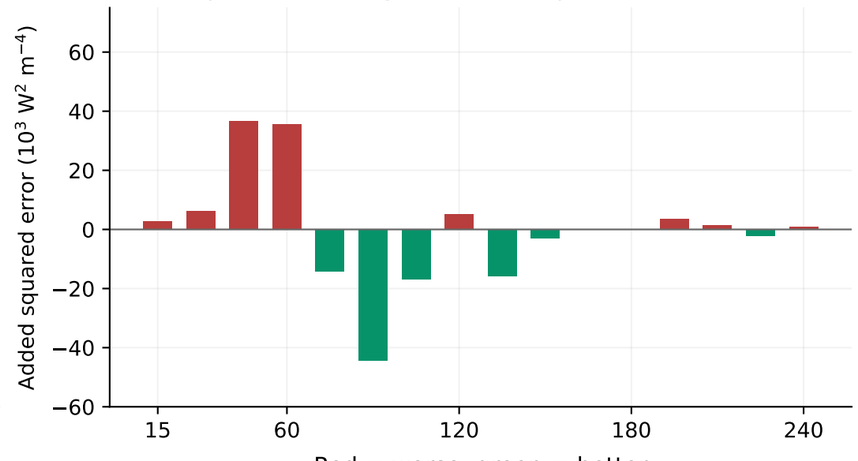
Case 2: Sili | 2025-07-08 13:15:00 BJT
AC minus A case RMSE: -0.87 W m^{-2}



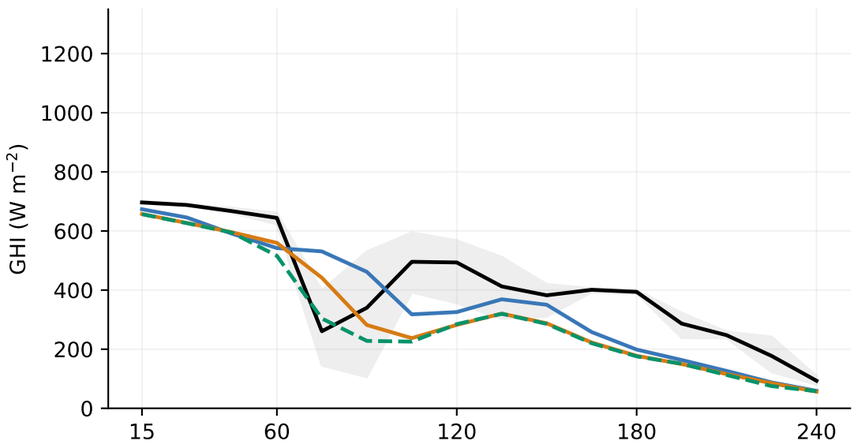
AC often lowers GHI where A already underestimates



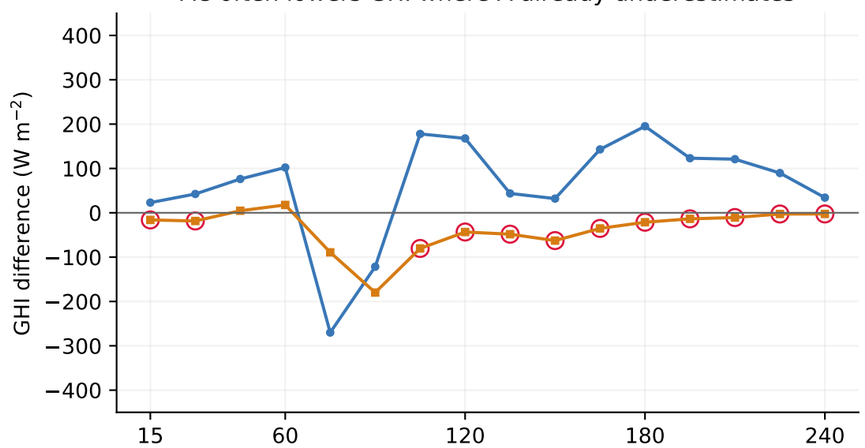
Red = worse; green = better
Top 3 harmful targets: 84.8% of positive added SSE



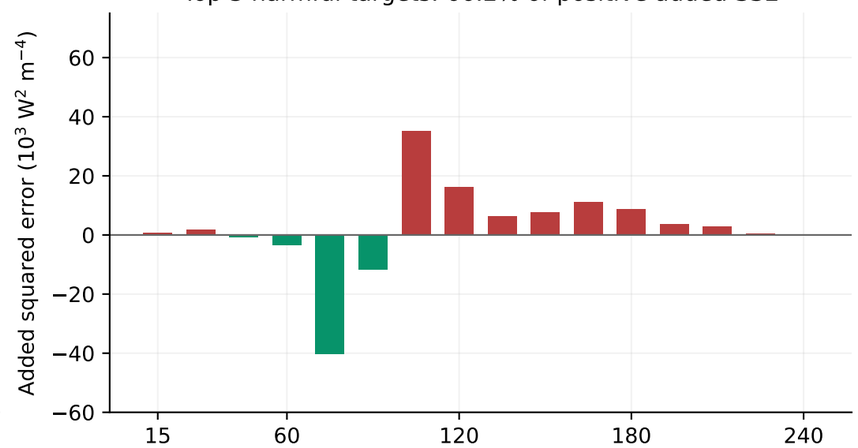
Case 3: Zhujia | 2025-07-09 14:30:00 BJT
AC minus A case RMSE: +8.94 W m^{-2}



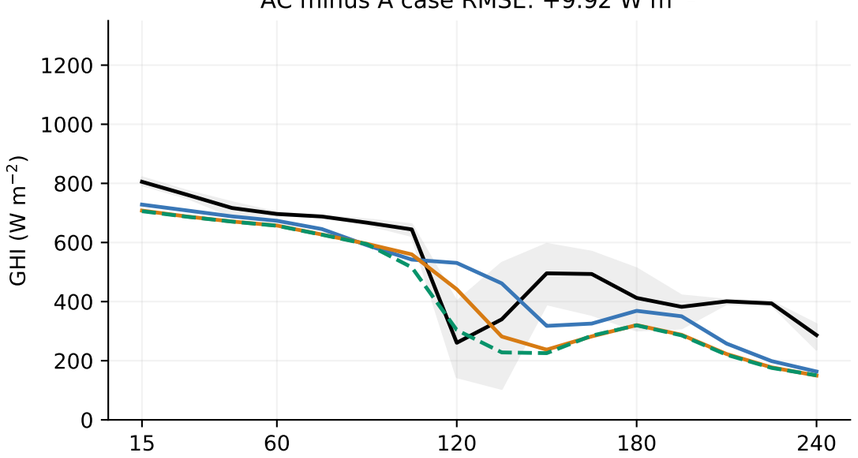
AC often lowers GHI where A already underestimates



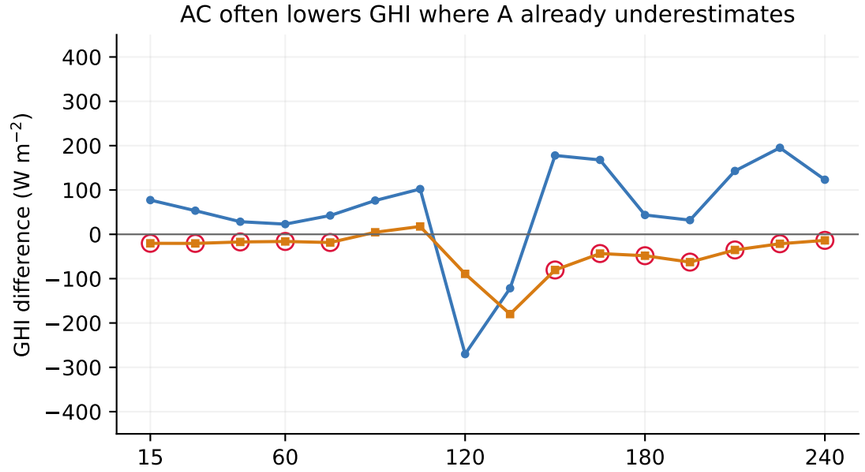
Red = worse; green = better
Top 3 harmful targets: 66.2% of positive added SSE

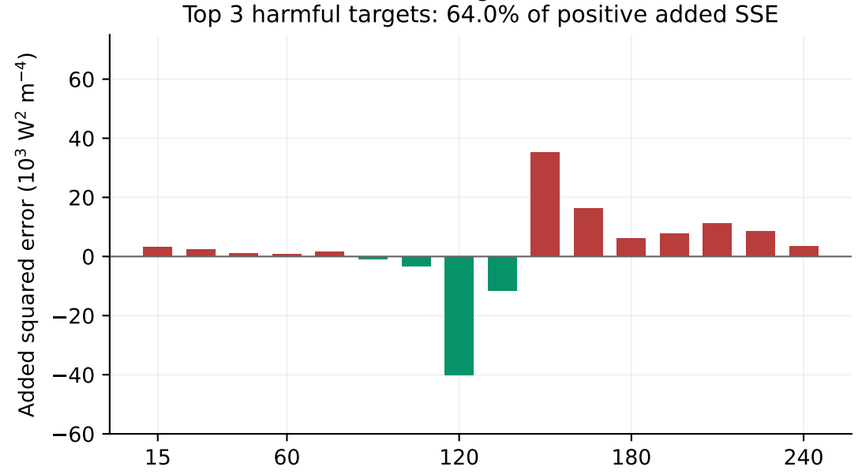


Case 4: Zhujia | 2025-07-09 13:45:00 BJT
AC minus A case RMSE: +9.92 W m^{-2}



AC often lowers GHI where A already underestimates





Red = worse; green = better
Top 3 harmful targets: 64.0% of positive added SSE
