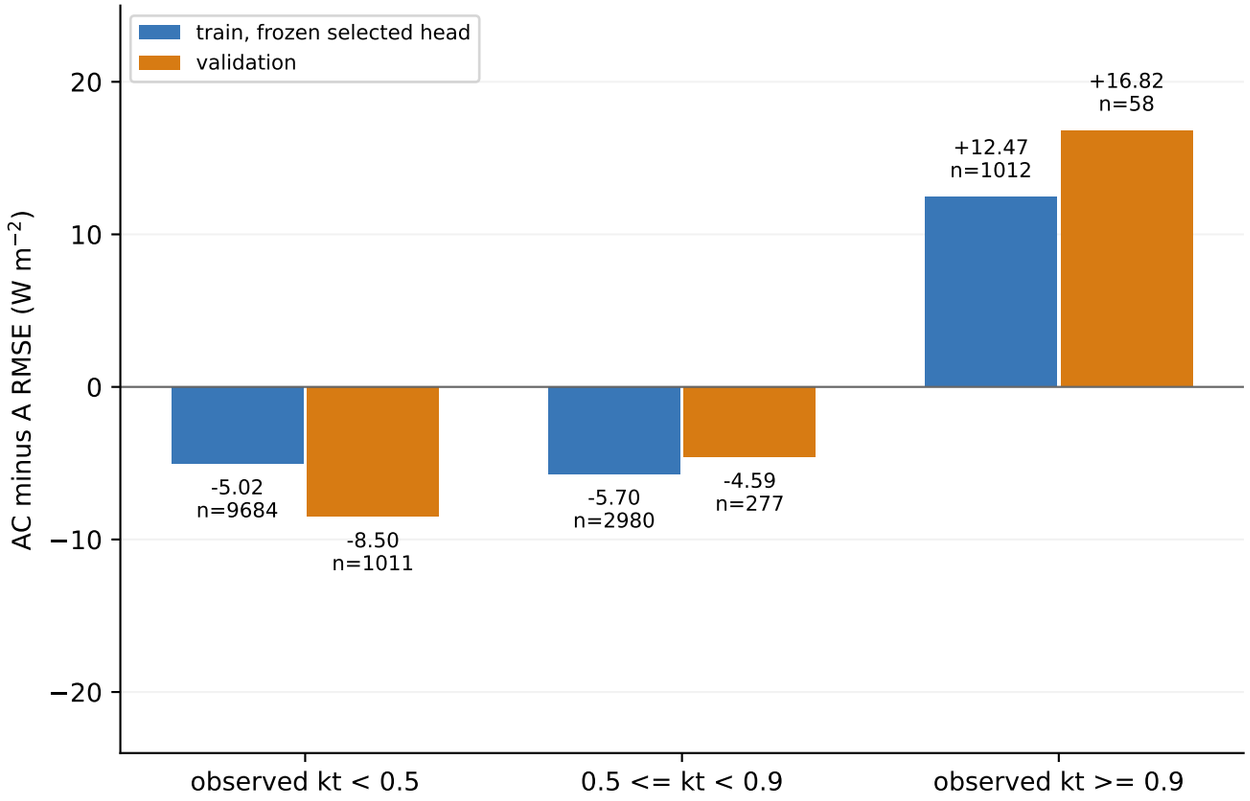
Mechanism evidence across train and validation

Post-hoc observed-kt groups use the target and cannot serve as a deployable gate. No test data; no subgroup confidence intervals.

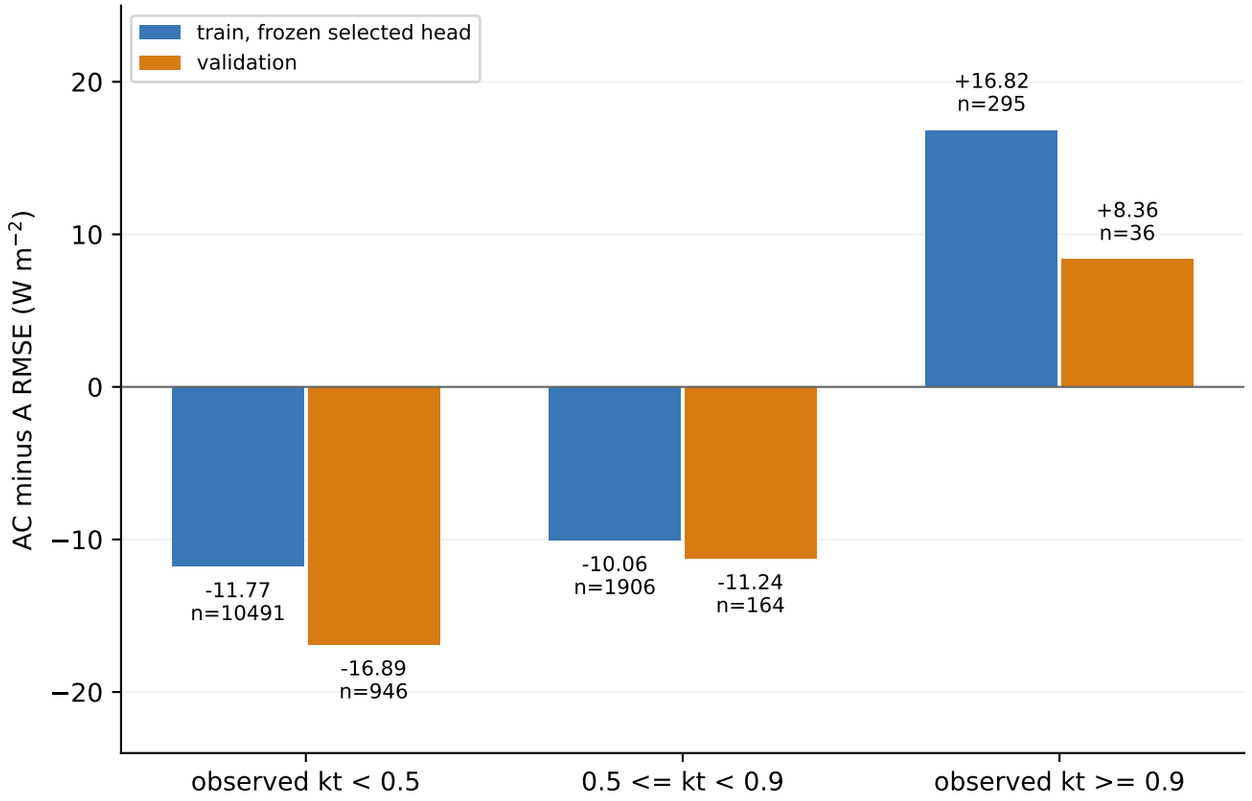
Sili: cloud-present but bright intervals fail

R centre COT >= 3; clear-sky GHI >= 100 W m^{-2}



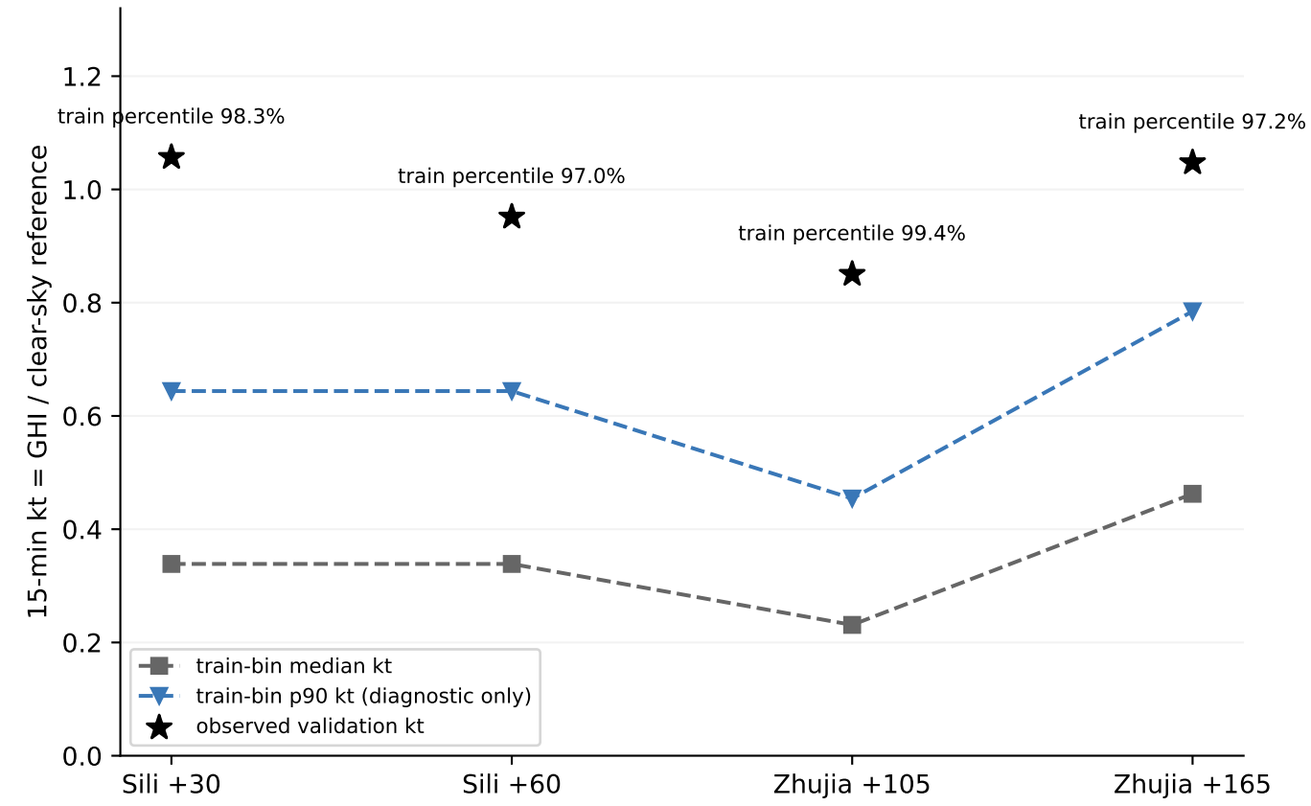
Zhujia: cloud-present but bright intervals fail

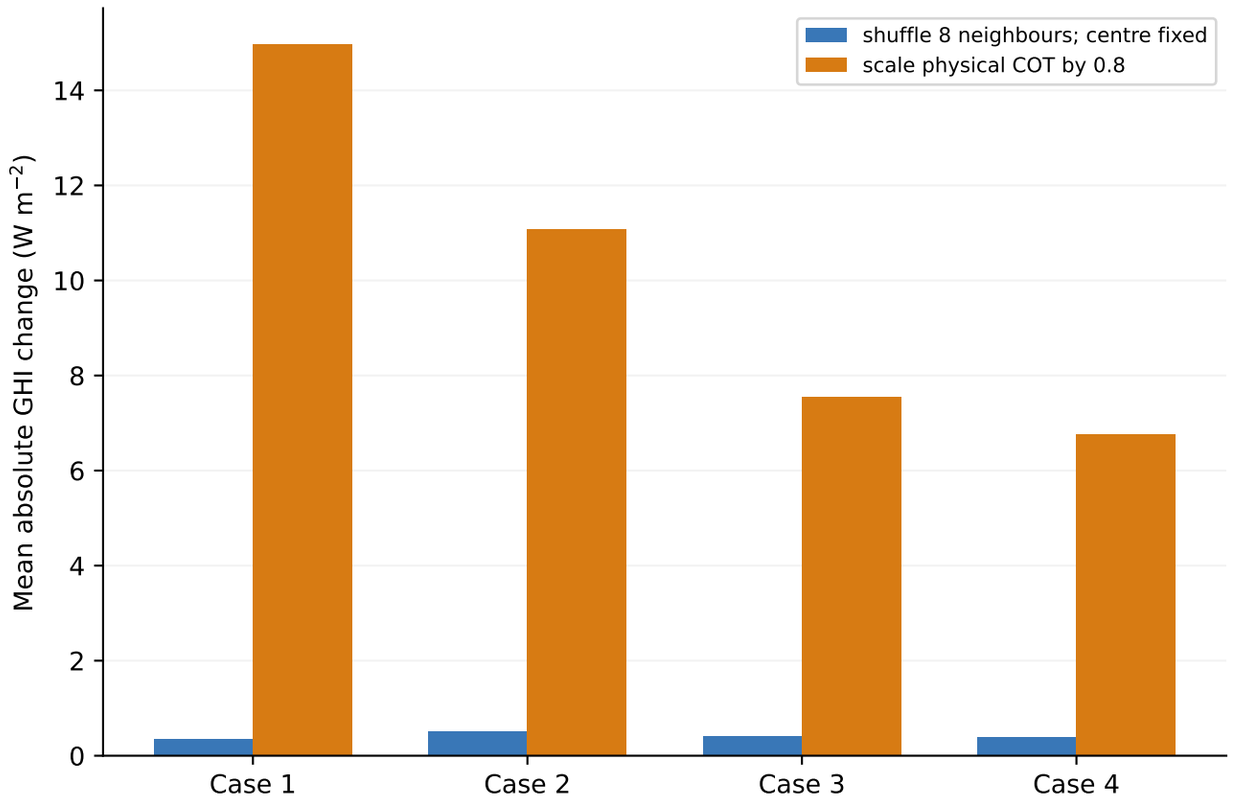
R centre COT >= 3; clear-sky GHI >= 100 W m^{-2}



Harmful targets lie in the bright tail of coarse train conditions

Same station, centre-COT bin and solar-cosine bin; not all-input conditioning



Frozen AC: much more response to COT level than arrangement


Sensitivity probe only; 0.8 is not a calibration recommendation
