Original HDF scan times: a support mismatch, but not a complete explanation
Left: rapid transition after label end. Right: observed GHI stays high despite AC underestimation.
Selected post-hoc targets within frozen validation cases; no labels moved; later observations are diagnostic only.
Sili 2025-07-09 14:15 BJT
R/CPP centre COT: 16.10/20.27
15-min observation: 824.3
A prediction: 413.0
AC prediction: 357.9
end of scored 15-min label
actual AGRI row scan: +3.07 min
observed mean within each 5-min interval
GHI (W m−2)
Minutes relative to nominal target time / label end
Zhujia 2025-07-09 17:15 BJT
R/CPP centre COT: 3.89/3.79
15-min observation: 400.9
A prediction: 258.0
AC prediction: 222.7
end of scored 15-min label
actual AGRI row scan: +2.66 min
observed mean within each 5-min interval
GHI (W m−2)
Minutes relative to nominal target time / label end
